

## Module 10 Problem 5

### Conversions used:

- Using the entity type conversion rule Account table is created with Acctid as the primary key and AcctName, Balance as the other columns.
- Using the 1-M relationship rule a foreign key decAcctid is added to the list for the *decomposed* 1-M relationship and not null constraint is not needed for this.

### The table is:

Account (Acctid, *decAcctid*, AcctName, Balance)  
FOREIGN KEY (decAcctid) REFERENCES Account
